Abstract

Background

Volunteers and citizen science initiatives play a crucial role for the documentation of species occurrences and distributions. When quality-checked and openly available, such data can provide information for biodiversity research and nature conservation. While some large international platforms reach a high number of opportunistic users around the world, there are also many smaller and regional citizen science initiatives, which often collaborate very closely with local authorities, conservation organisations and local experts and volunteers. Despite their high quality, data from such regional initiatives are often missing from global open data platforms, such as the Global Biodiversity Information Facility (GBIF).

New information

Here, we present a quality-checked citizen science dataset published on GBIF with more than 1 million georeferenced species records with a geographic focus on the German federal states of Rhineland-Palatinate (Rheinland-Pfalz) and Berlin. The dataset originates from the collaborative observation platform ArtenFinder, which is run by the two federal states. While each state branch administers its own web platform, they share a common database. Users can upload, edit, manage and share their observations of animals, plants and fungi. Experts validate the species records, based on photographs and other media as well as on plausibility, which allows the data to be used by state authorities and for conservation management and research purposes. The data mobilisation and publication were enabled by the German National Research Data Infrastructure for Biodiversity (NFDI4Biodiversity) and the dataset is now also available through the Living Atlas of Nature Germany platform, a GBIF hosted portal.

Keywords

citizen science, biodiversity monitoring, volunteers, ArtenFinder, NFDI4Biodiversity, Berlin, Rhineland-Palatinate

Introduction

Citizen science activities focused on biodiversity monitoring have surged over the past decade, significantly enhancing our understanding of species distributions and the dynamics of our changing biosphere (Chandler et al. 2017, Pocock et al. 2018, Stephenson and Stengel 2020). Citizen science projects are organised at different spatial scales, from small local conservation and monitoring projects to large global citizen science platforms, acting as social networks for nature observations (Richter et al. 2018). While many of the international players have crowd-sourced and published increasingly large amounts of open biodiversity data from around the globe (e.g. iNaturalist Contributors (2024), Observation.org (2024)), species records from many regional and small-scale citizen science initiatives remain relatively inaccessible to the broader scientific community (Engel et al. 2023). However, it is often especially the local and regional organisations that engage with and are trusted by local experts, authorities and volunteers, producing very targeted and high quality species occurrence data.

Despite the large volume of data generated by global citizen science initiatives, local nature conservation agencies in Germany and elsewhere make limited use of such widely-available data. Reasons for the low pick-up of citizenscience data include concerns over data quality and data validation and a lack of technical interfaces, hindering the incorporation of citizen science data into government databases and workflows (Owen and Parker 2018). At the same time, nature conservation agencies themselves have long relied on lay and expert volunteers for their own monitoring and species recording activities. While these government-held data are crucial for local conservation management, they are usually not readily available to the international research community and even local NGOs and citizens (Wetzel et al. 2018). Making data FAIR (i.e. findable, accessible, interoperable and reusable) is considered a major priority for research in general (Wilkinson et al. 2016) and participatory research and citizen science in particular (Hansen et al. 2021).

ArtenFinder is a regional citizen science platform in Germany, supported by the federal states of Rhineland-Palatinate (Rheinland-Pfalz) and Berlin and run by regional conservation organisations. The platform supports a very active community of lay and expert volunteers engaged in species recording, identification and validation. The data collected through the ArtenFinder system are largely opportunistic species occurrence data, which provide information for the work of the nature conservation agencies and non-government organisations in the two federal states. Here, we have mobilised the dataset to the Global Biodiversity Information Facility (GBIF) making it widely accessible to researchers around the world.

General description

Purpose: ArtenFinder was established in 2011 in Rhineland-Palatinate by a consortium of nature conservation NGOs (including Pollichia e. V., NABU|naturgucker and BUND) and the Ministry of the Environment Rhineland-Palatinate. In 2018, the Stiftung Naturschutz Berlin joined as project member. In 2020, the Stiftung Natur und Umwelt Rheinland-Pfalz assumed supervision of the platform, together with the Stiftung Naturschutz Berlin. The federal states of Hesse and North Rhine-Westphalia are associated partners.

The main purpose of ArtenFinder is to collect high quality species occurrence data for conservation purposes in Rhineland-Palatinate and Berlin as well as for faunistic and floristic research. ArtenFinder is managing a community of volunteers and a network of taxonomic experts, offering identification courses, excursions and community events (e.g. recording events for invasive species). Additionally, ArtenFinder seeks to deepen the public's connection with nature by providing accessible information on local species occurrences and fostering an appreciation for biodiversity in their immediate surroundings.

At the heart of the project are the ArtenFinder recording portals of Rhineland-Palatinate (https://artenfinder.rlp.de/) and Berlin (https://berlin.artenfinder.net/) and the ArtenFinder web app (https://artenfinder.net/artenfinder-pwa/). They are available in German language and enable registered users to upload, edit, manage and share their species observations. Observations from both federal states feed into a shared database, which is connected to the states' nature conservation agencies. Furthermore, validated data are published to GBIF through the BioCASe Provider Software (i.e. Biological Collections Access Service, https://www.biocase.org/products/provider_software). Additionally, the data are now also available in the national biodiversity portal Lebendiger Atlas der Natur Deutschlands, which is a GBIF-hosted portal for species occurrence data. The data mobilisation to GBIF was enabled by the German National Research Data Infrastructure for Biodiversity (NFDI4Biodiversity). All figures and numbers in this manuscript reflect the dataset as of 31 December 2024, which amounts to more than a million records.

Sampling methods

Sampling description: The large majority of records in this dataset consists of opportunistic species occurrence data collected by volunteers through the ArtenFinder portal (Fig. 1). The minimum data requirements for species observations submitted to ArtenfFinder are spatial coordinates and a date. In addition, it is possible and strongly recommended to provide pictures, sound files and more detailed descriptions of the specific observation. The system also allows to record information such as life stage, breeding status and the number of individuals. However, this information is currently not published to GBIF. Aside from the opportunistic citizen science data, the ArtenFinder datasets also include a smaller number of species records from more systematic and professional monitoring activities. This includes data from natural history societies (e.g.

Arbeitskreis Heimische Orchideen) and professional monitoring activities carried out by the organisations directly involved on the ArtenFinder Project (e.g. European hamster monitoring carried out by Stiftung Naturschutz RLP).

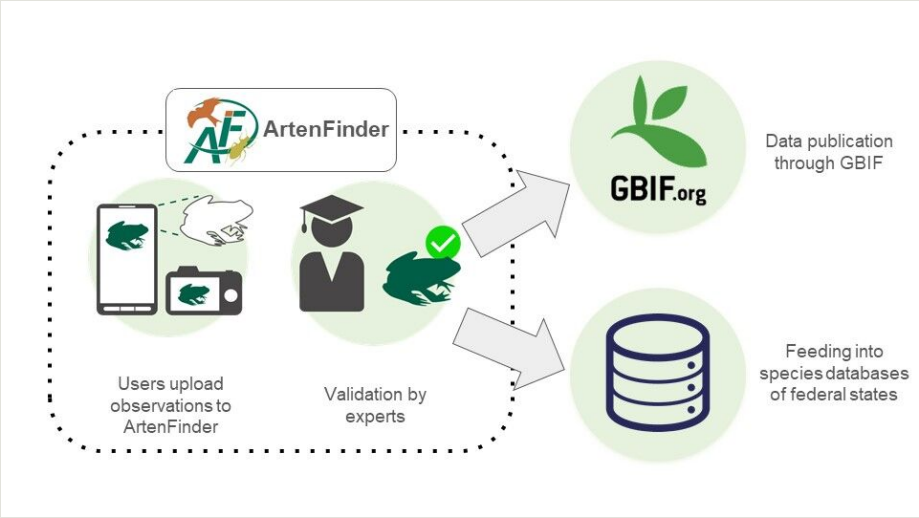

Figure 1. doi

ArtenFinder data pipeline from users to expert validation to integration in GBIF and federal state authorities databases.

In most cases, the dataset provides exact coordinates for records. However, users can flag observations as sensitive and all records of threatened or rare species are automatically marked as sensitive within the ArtenFinder system. For these records, locations are shared as the centroid of a 5 km × 5 km grid cell containing the sensitive observation.

Quality control: Since most of the data are collected by untrained volunteers and the main purpose of the collected data is to provide information for federal nature conservation purposes, quality control is a high priority in the ArtenFinder project. A group of more than 50 taxonomic experts are involved in data validation based on photographs and other media as well as on the plausibility of records. To become an expert for a taxonomic group, a proof of taxonomic expertise is necessary. A proof can, for example, be a relevant scientific career, peer-reviewed publications on the taxonomic group in question, membership in a relevant natural history society or simply being a well-respected expert for the given taxon.

Although providing a photo or sound file is not mandatory for reporting a species observation to ArtenFinder, data validation heavily relies on such media. Consequently, records lacking photo or sound evidence are rarely included in the validated dataset presented here. Exceptions are made for records submitted by users with demonstrable taxonomic expertise for the species in question (e.g. more than five previously validated records of the same species). Furthermore, users can evidence their records by providing

a written description of their sightings, highlighting the characteristics that distinguish the recorded species from similar species.

Geographic coverage

Description: While it is generally possible to submit species records from around the globe to ArtenFinder, more than 99% of the records are from Germany. The majority of recording sites are located in the State of Rhineland-Palatinate and surroundings and a smaller number in and around the State of Berlin, where the project started later and which covers a smaller area. Within Rhineland-Palatinate, there is an imbalance with more records in the southern parts than in the northern parts. Additional records are scattered in the rest of Germany; however, most data are from the southwest of the country (Fig. 2A).

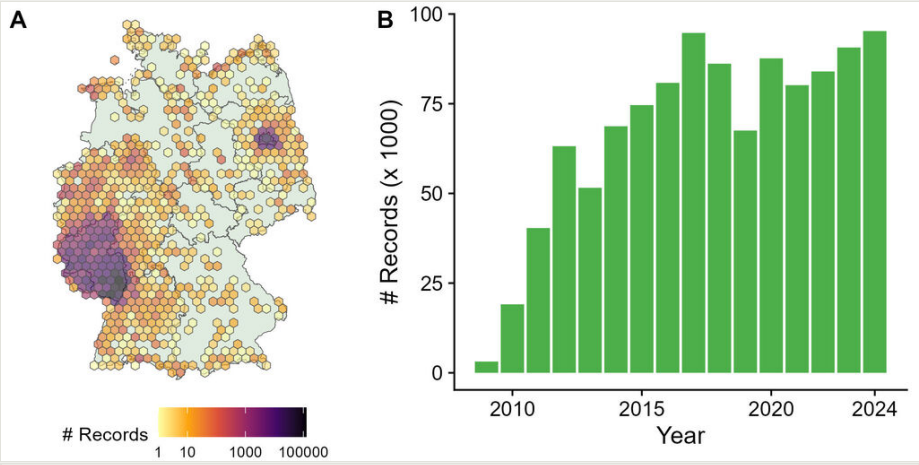

Figure 2. doi

Geographic and temporal scope of the ArtenFinder dataset. **A** Spatial distribution of the records in Germany, based on a 20 km hexagonal grid. Records from outside of Germany are omitted in this figure (i.e. < 1% of data); **B** Number of records per year. Records from before 2009 are omitted in this figure (i.e. < 1% of data).

Taxonomic coverage

Description: The dataset has a very broad taxonomic scope, reflecting the species observations of the ArtenFinder users. However, most observations are on bird and arthropod species, with a smaller share of other animal taxa, plants and fungi (including lichens) (Fig. 3). Table 1 summarises the taxonomic coverage of the dataset at the order level, including the number of records and the number of recorded species per order.

Table 1.

Taxonomic coverage of the dataset at the order level with number of records and recorded species per order. The taxonomy was matched against the GBIF taxonomic backbone (some cells are left blank for this reason). Note that the table is ordered alphabetically.

Temporal coverage

Notes: While more than 99% of the data were recorded after the launch of the project in 2011, the dataset contains a small number of records from earlier years (Fig. 2B). This is because retroactive data entry is also possible and there have been some data imports of previously existing records. The data collection is still ongoing and the ArtenFinder dataset on GBIF is updated weekly.

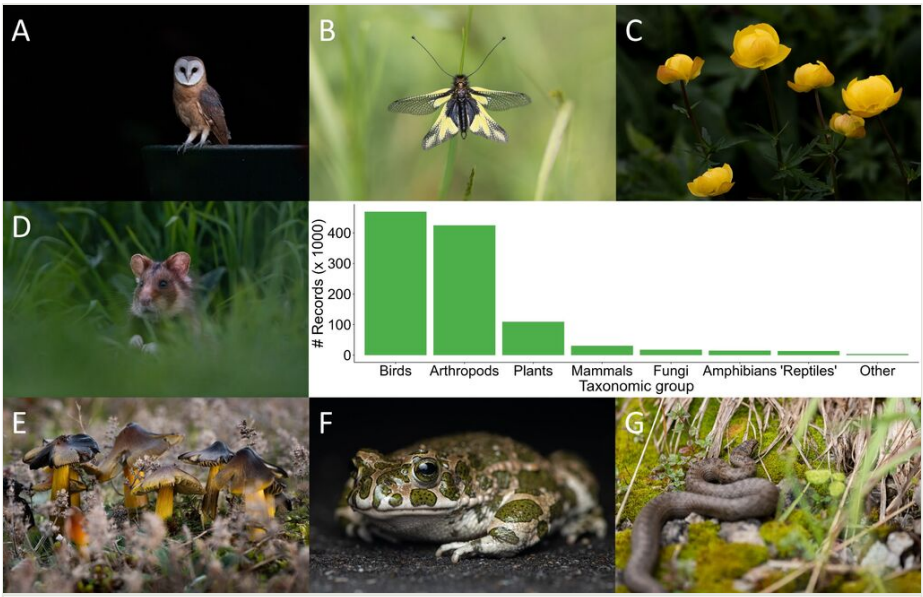

Figure 3. doi

Taxonomic distribution of the ArtenFinder dataset with exemplary photos, representing: **A** birds (*Tyto alba*); **B** arthropods (*Libelloides coccajus*); **C** plants (*Trollius europaeus*); **D** mammals (*Cricetus cricetus*); **E** fungi including lichens (*Hygrocybe conica*); **F** amphibians (*Bufotes viridis*); **G** "reptiles" (*Coronella austriaca*). Data resources

Data package title: ArtenFinder dataset on GBIF

Resource link: https://doi.org/10.15468/jnnald

Alternative identifiers: https://artenfinder.rlp.de/biocase/pywrapper.cgi?dsa=artenfinder

https://www.gbif.org/dataset/aa6c5ee6-d4d7-4a65-a04f-379cffbf4842

Number of data sets: 1

Data set name: ArtenFinder dataset on GBIF

Character set: UTF-8

Download URL: https://doi.org/10.15468/dl.77k8wp

Data format: DarwinCore Archive

Description: This is the ArtenFinder dataset available through GBIF. The dataset is provided to GBIF through the BioCASe Provider Software using the ABCD data standard (Access to Biological Collections Data). The ABCD XML archive harvested by GBIF is refreshed weekly. The download link above reflects the static dataset at the time of writing this manuscript (17.02.2025). The resource link directs to the dynamic dataset on GBIF.

Since GBIF maps ABCD elements to the DarwinCore standard and since the GBIF download comprises a DarwinCore archive, the respective DarwinCore terms are given below. Only data items provided by ArtenFinder are listed here, not fields inferred and added by GBIF (e.g. higher taxonomy, administrative areas etc.).

Column label	Column description
occurrenceID	A globally unique identifier for the observation.
catalogNumber	A unique identifier within the dataset; same as occurrenceID.
institutionCode	The name in use by the institution having custody of the object(s) or information referred to in the record.
collectionCode	The name identifying the dataset from which the record was derived.
references	A related resource that is referenced by the described record. In our case, it is a link to a machine-readable representation of the observation serialised as XML.
license	A legal document giving official permission to do something with the resource. ArtenFinder publishes data under a Creative Commons 1.0 Public Domain Dedication licence (http://creativecommons.org/publicdomain/zero/1.0/).
basisOfRecord	The specific nature of the data record; for ArtenFinder, it is "HumanObservation".
occurrenceStatus	A statement about the presence or absence of the taxon at the given location; for all ArtenFinder records, it is "present".
eventDate	The date at which the organism has been observed.
decimalLongitude	The geographic longitude (in decimal degrees, using the spatial reference system given in geodeticDatum) of the observation.
decimalLatitude	The geographic latitude (in decimal degrees, using the spatial reference system given in geodeticDatum) of the observation.
geodeticDatum	The ellipsoid, geodetic datum or spatial reference system (SRS), upon which the geographic coordinates given in decimalLatitude and decimalLongitude are based. In our case, it is "WGS84". Within the DarwinCore archive, this information is stored in the file meta.xml.
dateIdentified	The date on which the organism was determined as representing the taxon.

scientificName	The full scientific name of the taxon including at least genus name and species epithet and, in some cases, including a subspecies epithet or variety. For some records of the ArtenFinder dataset, this field also contains species aggregates or taxonomic names that are not resolved at the species level.
coordinateUncertaintyInMeters	The horizontal distance (in metres) from the given decimalLatitude and decimalLongitude describing the smallest circle containing the whole of the location. Sensitive ArtenFinder records are shared as centroids of a 5 km x 5 km grid cell, corresponding to a value of 3536.

Additional information

The authors acknowledge that there are also other well-established species recording platforms and citizen-science apps available in the study area, some of which are more targeted to specific taxa or user communities (e.g. Ornitho for birds). Many ArtenFinder users and experts are active on many of these platforms and there are ongoing efforts to establish data flows between ArtenFinder and other initiatives with open data policies (e.g. NABU|naturgucker and Observation.org). These imported data, however, are not and will not be part of the GBIF ArtenFinder dataset described here, as they are already published by the original data holders.

Acknowledgements

We are grateful to the many volunteers who have contributed to this dataset by uploading their species observations to ArtenFinder. We also thank the dedicated experts who have been essential for data validation. Furthermore, we thank "u-werk" for their support with the database infrastructure. We are also deeply grateful to the institutions that support the ArtenFinder project, including Pollichia e.V., Stiftung Natur und Umwelt RLP, Ministerium für Klimaschutz, Umwelt, Energie und Mobilität (Rheinland-Pfalz), Stiftung Naturschutz Berlin and Senatsverwaltung für Mobilität, Verkehr, Klimaschutz und Umwelt (Berlin). We thank Friedrich Fläming for the assistance with the manuscript management using the Arpha Writing Tool. TE, MFM, JH and AB were supported by the German Research Foundation (DFG) under the grant agreement number 442032008 (NFDI4Biodiversity). Furthermore, TE, MFM and AB acknowledge the support of the German Research Foundation to the German Centre for Integrative Biodiversity Research (DFG-FZT 118, 202548816).
